

MOBA Mobile Automation wins Bauma Innovation Award 2019

MOBA Mobile Automation has prevailed against two other finalists with its new development PAVE-TM and won the bauma Innovation Award 2019 in the category 'component, digital system'. The award was presented on Sunday evening shortly before the opening ceremony of bauma 2019, the world's leading trade fair for the construction industry.

Limburg, 07 April 2019

Winning System PAVE-TM

The world's first layer thickness measurement system for road construction, PAVE-TM, convinced with its specially developed sensor CSMT-300, which specializes in layer thickness.

As an add-on system on the paver, the system supports the paving team and continuously displays the current layer thickness on both control stations. Without having to leave the paver for manual measurements, this increases the safety of the operators, who now have more time for other important tasks for quality assurance of the road.

Thanks to the precise measurement of the layer thickness and simple adjustments to the screed in just a few simple steps, as little asphalt as possible can be paved without falling below the lowest tolerance limit. At the end of the project, this means considerable economic savings in terms of material and costs. The environment benefits equally from this resource-saving paving method.

Category „Component, Digital System“

As the winner of the category „component, digital system“ PAVE-TM exceeds all requirements. The digital system upgrades every paver and revolutionizes road construction in terms of economy, environmental friendliness and occupational safety.

Bauma Innovation Award

Every three years, the bauma Innovation Award honours the latest developments in the construction industry, which are presented for the first time at bauma. In five categories, future-oriented products or processes that sustainably advance the industry are honoured. Criteria such as degree of innovation, practical orientation, contribution to environmental protection and humanization of the workplace as well as economic potential are decisive for a nomination.

MOBA Mobile Automation

The innovations of MOBA Mobile Automation all have a common goal: to continuously increase the quality of road construction. Thus PAVE-TM complements the Paving Quality series of the technology company with another future-oriented system. With award-winning developments such as this, the global player has repeatedly succeeded in setting new standards in the industry.
